E-Mail: dnfs@kilimo.go.tz Dar es Salaam, Tanzania

Dar es Salaam June, 2012

Main Highlights

- ♦ The 2011/12 Preliminary Food Crop Production Forecast amounts 13,572,804 tonnes grain equivalent of which 7,558,342 tonnes constitute cereals and 6,014,463 tonnes comprise noncereals. Requirement for 2012/13 marketing year amounts 11,990,115 tonnes of which cereals make up 7,551,244 tonnes and non-cereals constitute the rest 4,438,870 tonnes. Based on these availability and requirement figures, a self sufficient status of 113% is attainable in terms of total food crops whereby cereals make up 100% and non-cereals make up 135%. In terms of gap/surplus analysis, this is respectively, 1,582,690 tonnes surplus of total food, of which 7,097 tonnes constitutes cereals and 1,575,592 tonnes surplus is non-cereals.
- ♦ At sub-national level, there is evidence to indicate that: 7 regions will be definitely surplus, 8 regions will be definitely self-sufficient and 6 regions will be definitely deficit. Here and there, pockets of vulnerable areas are signaled in 63 LGAs in 17 regions. The identified vulnerable areas will need to be subjected to an in-depth vulnerability assessment towards a necessary intervention.
- ♦ Compared to previous season, production increase of 5% has been observed in total food (1% increase in non-cereals and 7% increase in cereals). Specific cases of increase were mainly notable in double digits percentage values in maize (21%), cassava (20%) and pulses (12%), while the decline was also evident in double digits in rice (23%) millets (22%) potatoes (16) and bananas (14). Other single digit changes are as per Appendix 8. The 5% broad gain is due to, among others, improved rains in respect of timely onset and a fairly appropriate distribution experienced over the season. Other factors like input subsidies particularly in cereals could as well have a stake in this respect.
- ♦ An analysis of carryover stocks (COS) shows that, on the eve of new marketing year 2012/13 (i.e. the midnight of 1/06/12) a total of 462,213 tonnes food stock was carried over into 2012/13 marketing year of which 77,935 tonnes was held in NFRA (National Food Reserve Agency) warehouses while 153,172 tonnes was held by private stockists and 231,107 tonnes was estimated as farm retention. Together with the 1,582,690 tonnes of food surplus arrived at as above, the total food availability, over and above national requirement becomes 2,044,903 tonnes.
- ♦ It is however cautioned that the forecast is sensitive to vuli performance and about 451,352 tonnes is likely to deplete off substantially reducing the amount in forecast. The Vuli contribution which would normally be 2,360,483 tonnes is currently predicted to stand at 1,909,131 tonnes signifying a possible draw-down impact as indicated if trends maintain the usual performance.
- ♦ It is highly recommended that the earmarked food surplus areas and food deficit areas are seen as opportunities and challenges that need to be appropriately addressed. Local market potential as per deficit signals should be well exploited prior to external orientation of surplus food as comparative advantage opens doors in the context of food and seed without borders especially around integrated EAC and SADC regions. And, the local import-export interaction points currently under establishment should be enhanced for transparency purposes and in an endeavour to clear off unofficial entry-exit points through ever increasing border porosity.

Background

During the month of June, 2012 the National Food Security Division (Crop Monitoring and Early Warning) carried out a regular preliminary food crop production forecast survey to ascertain food crop harvest status for 2011/12 and the corresponding availability for 2012/13. While the main objective was to determine the preliminary status concluded through capturing the effect of influential crop production factors that ruled over the growth stages from seed germination to maturity, specific objectives were threefold: **first**, to establish statistically if food crop production has a substantial influence in agricultural performance, **secondly**, if national and local level food security status can be accounted for using the forecasts and, **thirdly**, if food security vulnerability is adequately detected to warrant vulnerability assessment.

The exercise involved collection of the 2011/12 data and information from all 133 LGAs of mainland Tanzania in collaboration with Regional Agricultural Advisors (RAAs) and the District Agricultural and Livestock Development Officers (DALDOs) partly through routine crop monitoring and early warning tools and partly through actual fielding of MAFC teams of experts to ground proof crop performance in both unimodal and bimodal areas correspondingly in respect of *msimu* and *vuli* rainfall patterns of the 2011/12 crop season. Comprehensive analyses covering different retrievals were undertaken and results are presented in this report. The results concentrate on national and regional level food status with main highlights of regions and districts bearing vulnerable areas.

Methodology

Briefly, the methodology of crop forecasting essentially combined 3 consecutive steps, Eye estimation approaches (EEM) used by DALDOs, Projective-forecasting (PFM) used by MAFC and the Food crop production forecasting sample survey (FCPFS) with background of joint design, test and approval by NBS and MAFC under the technical guidance of FAO and later manned by MAFC. Later on, in the process of analyzing Self Sufficiency Ratios (SSR) and National Food Balances (NFBS) also following the technical guidance of FAO, the methodology extends to the calculation of food production in grain equivalent terms.

While Area and Production estimates largely borrows from DALDO estimates and partially improved by projective forecasting methods, Yield is largely improved by Agrometeorological approaches that borrow from plant-water-satisfaction indices and Production is computed and presented in grain equivalent terms. Self Sufficiency Ratio (SSR) calculations follow a simple food adequacy principle whereby production is related with requirement encompassing consumption and other uses based on requirement parameters employed by CMEW (See Appendix 8) and is presented in percentage terms.

Findings

SSR shows the extent of deficits and surpluses as a locally available and accessible surplus sink and emergency based vulnerability management before considering external market opportunities available in neighbouring countries or elsewhere. From the analysis, it has been found that 13,572,804 tonnes of food crops will be available from farm production comprising 7,558,342 tonnes of cereals¹ and 6,014,463 tonnes of non-cereals² (Table 1, Figure 1, Appendix 1 and Appendix 2) and will meet national food requirement amounting 11,990,115 tonnes of food by 113

¹ The cereal crops covered under CMEWS include maize, sorghum, millets, rice and wheat.

² The non-cereals include pulses, cassava, banana and potatoes

percent implying a **1,582,690** tonnes of surplus food (Table 1, Appendix 2). An alternative approach is the national food balance sheet which relates country to country food balance status to guide policies of whether to export or import and the extent thereof.

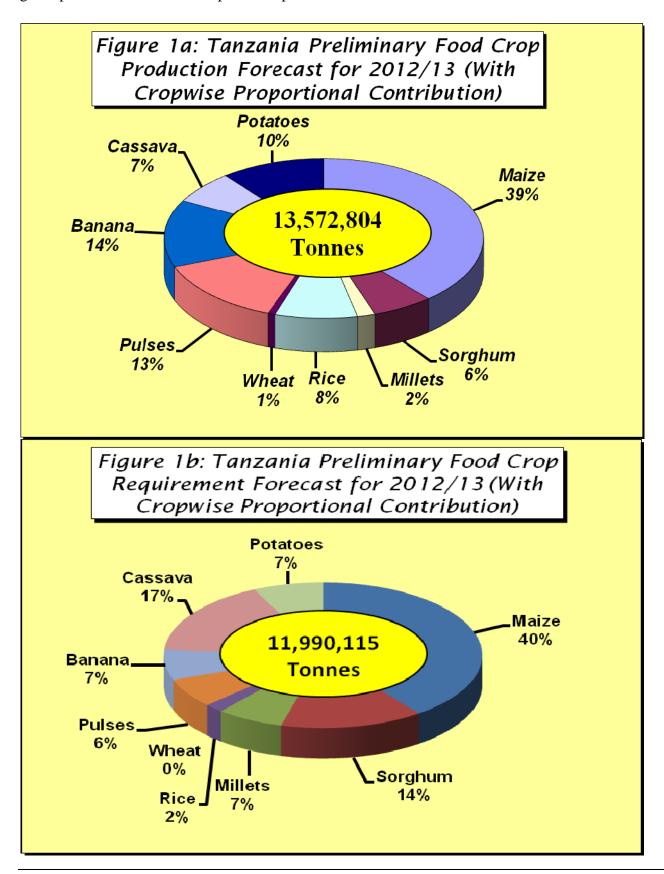

Table 1: The 2011/12 National Level Preliminary Food Crop Production versus Requirement and gap(-)/surplus(+) analysis for 2012/13 (Grain Equivalent tonnages)

Cereals	Maize	Sorghum& Millets	Rice	Wheat	Cereals
Production	5,240,001	1,087,177	1,128,326	102,837	7,558,342
Requirement	4,764,612	1,740,245	815,841	230,546	7,551,244
Gap (-)/ Surplus(+)	475,389	-653,068	312,485	-127,709	7,097
SSR (%)	110	62	138	45	100
Non-cereals	Pulses	Banana	Cassava	Potatoes	Non-Cereals
Production	1,824,178	896,853	1,857,156	1,436,275	6,014,463
Requirement	780,000	802,008	2,002,425	854,438	4,438,870
Gap (-)/ Surplus(+)	1,044,178	94,845	-145,268	581,837	1,575,592
SSR (%)	234	112	93	168	135
TOTAL	Cereals	Non-Cereals			TOTAL
Production	7,558,342	6,014,463			13,572,804
Requirement	7,551,244	4,438,870			11,990,115
Gap (-)/ Surplus(+)	7,097	1,575,592			1,582,690

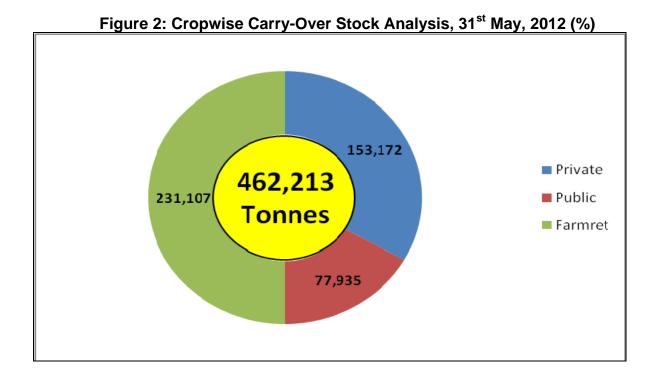

Carryover Stocks Analysis and its reflection to total surplus availability

An analysis of Carryover Stocks (COS) shows that, on the eve of new food marketing year (1st June, 2012) a total of **462,213** tonnes of food stock was carried over into 2012/13 marketing year, of which 77,934.937 tonnes was held in NFRA premises while **153,172** tonnes was held by private stockists and **231,107** tonnes was estimated as farm retention (Table 2 and Figure 2).

Table 2: Carryover Stocks Analysis, 1 June, 2012 (Tonnes)

May, 2012	Private	Public	Farmret	Total Stocks
Maize	8,710	77,935		86,645
Rice	93			93
Wheat	123,578			123,578
Sorghum	-	-		-
Pulses	20,791			20,791
cos	153,172	77,935	231,107	462,213

Added to the 1,582,690 tonnes preliminary forecast of food surplus arrived at as above, the total food available, over and above national requirement is **2,044,903** tonnes. On the cropwise basis, wheat is the largest followed by maize, pulses and rice is the smallest (Fig. 2).

Time series analysis

Time series analysis shows that, compared to previous season, production increase of 5% has been observed in total (7% in cereals and 1% in non-cereals). Cropwise swings vary from -23% in rice to +21 in maize with other crops standing as per Table 3 below and Appendix 6.

Table 3: Time Series Analysis of Production of Major Food Crops in Tanzania, based on available series (1986/87 - 2011/12) (Thousand Tonnes and Percentages as indicated)

Year	Maize	Sorghum	Millets	Rice	Wheat	Cereals	Pulses	Cassava	Bananas	Potatoes	Non-cereals	Total	Year
2011/12 (Preliminary)	5,240	843	244	1,128	103	7,558	1,824	1,857	897	1,436	6,014	13,573	2011/12 (Preliminary)
Trend Values	3,992	774	268	1,239	96	6,368	1,422	1,721	1,065	1,601	5,808	12,176	Trend Values
%age change from Trend Values	31	9	-9	-9	7	19	28	8	-16	-10	4	11	%age change from Trend Values
%age change from													%age change from year
year t-1	21	5	-22	-23	-9	7	12	20	-14	-16	1	5	t-1

Compared to trend values computed from 1992/93-2011/12 (a reasonable period of reliable food crop statistics), total tonnage stands up by 11% while total cereals stand up by 19% and non-cereals stand up by 4%. Individual crops swing between +31% in maize and -16% in bananas with bananas, potatoes, rice and millets showing negative swings and maize, pulses, sorghum, cassava and wheat showing positive swings. Comparisons with other measures in trend analysis such as 25 years average and 5 years average for total food crops, cereals and non-cereals as well as for different crops are as per Appendix 6. SSR vitiations overtime back to 1994/95 shows t hat except for 5 years where food shortage was nationally felt, the country was on average self sufficient in the range of 102-117%.

Vuli Contribution

Based on this preliminary forecast, the normal vuli contribution to total food crop production revises to 32% bimodal area perspective or 17% national aggregate perspective. As of current availability, it contributes 26% bimodal areas perspective or 14% national aggregate perspective. In tonnage terms, the amounts which would normally amount 2,360,483 tonnes currently stands at 1,909,131 tonnes. Notably, a possible draw-down impact of about 451,352 tonnes is predicted (Table 3).

Table 3: Vuli contribution to 2011/12 Preliminary Forecast – Current vs Normal Production (Based on 2011/12 Preliminary Food Crop Production Forecast)

	Total		uli contribution		ıli contribution
REGION	Production (T)	(%)	(T)	(%)	(T)
Bimodal-Tz	7,336,743	32	2,360,483	26	1,909,131
Total-Tz	13,572,804	17	2,360,483	14	1,909,131

The bimodal regions in order of falling strengths (80%-5%) are normally Kagera, Mwanza, Mara, Kilimanjaro, Arusha, Tanga, Morogoro, Coast, Dar es Salaam, Shinyanga and Mbeya. (It should be noted that Mbeya and Shinyanga are largely unimodal with traces of bimodality tendency) - See Appendix 2. Based on these percentage vuli contribution strengths, the 11 regions aggregate to 32% normally and 26% currently taking the proxy values of current production year. Since the vuli production that is relevant for 2012/13 consumption year actually comes from 2012/13 production season the figures will be revised along the final forecast survey which will be conducted in November/December 2012.

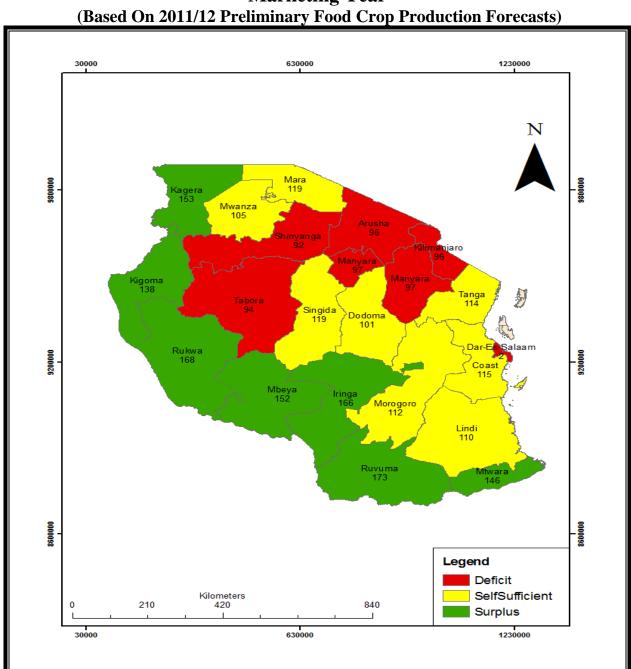

The possible draw-down impact of about 451,352 tonnes is estimated if trends maintain the usual performance and accordingly, it is cautioned that the forecast is possibly likely to experience this draw-down and hence the need for preparedness.

Sub-national level Food Security

At sub-national level, the 2011/12 production is expected to meet food requirement for 2012/13 marketing year in 15 regions of which 7 will produce surplus with SSR of 138% upwards to 173% and 8 regions which will produce at SSR of 101%-119%. The rest 6 regions will be produce at a definitely deficit status with SSR of 2%-97% (See Fig. 3). Notwithstanding, here and there, pockets of vulnerable areas are scattered over 63 LGAs in 17 regions of which 4 will produce surplus, 8 will only meet local demand and 5 will produce at deficit levels. Implicitly, 4 regions are declared free of agriculture related vulnerability (See Appendix: 3).

Figure 3: Total Food Supply Forecast at Regional level for the 20120/13

Marketing Year

Vulnerability

From the above, it is notable that except for Dar es Salaam, which is largely non-agricultural, the deficit regions (5 therefore) bear 31 districts with high level vulnerability. Furthermore, though self sufficient or surplus, further warnings are focused to 12 additional regions bearing pockets of food shortage in 32 additional districts 28 from definitely self sufficient regions and 4 from 4 definitely surplus regions. The rampant vulnerability amidst self sufficient and surplus food security status indicate that, the lower down the level from national the worse and the national self sufficient status mask the true colors that are better reflected at lower levels down towards household/individuals. Accordingly the following recommendations are worth working on.

Recommendations

- ◆ From above, a total of 63 districts in 17 regions identified to bear vulnerable areas will need to be subjected to an in-depth vulnerability assessment for necessary intervention by Government.
- ♦ The food surplus areas and food deficit areas should be seen as opportunities and challenges that need to be appropriately addressed. Local market potential following deficit signals should be well exploited prior to external orientation of predicted surplus as comparative advantage opens doors in the context of food without borders as well as seed without borders especially around integrated EAC and SADC regions.
- ♦ The local import-export interaction points currently under establishment should be enhanced for transparency purposes and in an endeavour to clear off unofficial entry-exit points through ever increasing border porosity. This should not take a business as usual style anymore but rather a business unusual Endeavour as local initiatives are high and foreign market sinks are encouragingly widening in favour of national growth potential.

Consumption year

Appendix 8: Methodological Considerations.

Production expressed in T – (Grain Equivalent) = Area (Ha) * Yield (T/Ha). NB: **Grain equivalent calculations** assume a common denominator among all cereals while roots, tubers and plantains compare at 1:3 ratio.

Requirement R = Average Per capita Consumption requirement of 650g/day + Parameter % estimates of production that is committed to other uses. Consumption requirement is estimated as average kg. per person per crop as follows: Maize 86kg, Millet18, Rice16, Sorghum 18, Wheat 5, Bananas18, Cassava 44, Potatoes 19, Pulses 13 totaling up to 237kg. Respective "other uses" are estimated as percentage extraction from produced crop that is used for mainly seed, feed, losses and trade as shown on the Table below.

Food Requirement Table
Parameters used for estimating food requirement per cop

		Consumption	Oth	ner uses (%	removed fr	om Produc	tion)
	Crop	Requirement per capita	Seed ²	Feed ²	Losses ²	Trade ²	Total
							%
		Kilograms	Percent	Percent	Percent	Percent	removed
Cereals	Maize ³	86	1.3	2	8.7	4.4	16.4
	Millet ⁵	18	2.3	0.6	7.7	0	10.6
	Rice ⁴	16	2.5	0	2.5	1.8	6.8
	Sorghum	18	1.5	0.6	8.5	0	10.6
	Wheat	5	2.5	0	2.5	0	5
Non-							
Cereals	Bananas ^{7,8}	18	0	0	0	0	0
	Cassava ⁷	44	0	0	0	0	0
	Potatoes ^{7,9}	19	0	0	0	0	0
	Pulses ⁶	13	5	0	2.5	2.5	10
Total		237					

P/R=SSR (expressed in %). SSR Categories are: Deficit (<100%), Self Sufficient <=100<120%, Surplus >=120%)

Vulnerable areas (VA): derived directly from RRS1 questionnaire as filled-in by DALDO statistical experts.

Requirement per day per person = 0.650 kilograms Cereal Equivalent

- 1 = Per capita annual consumption Cereal Equivalent
- 2 = Percent used from total production
- 3 = Whole grain
- 4 = Paddy converts to rice at 65 percent ratio.
- 5 = Includes bulrush and finger millet
- 6 = Mainly beans but other pulses (groundnuts, peas, grams etc) included
- 7 = Based on dry weight from which waste is already subtracted
- 8 = Includes sweet and cooking

bananas

9 = Includes round and sweet potatoes.
